SCALING ERLANG WEB APPLICATIONS 100 to 100K users at one web server

Fernando Benavides (@elbrujohalcon)

Inaka Labs

March 27, 2012

- I'm a developer since I was 10
- I worked with Visual Basic, C#, .NET, Javascript . . .
- I switched to functional programming in 2008
- I wrote my thesis project in Haskell
- I'm an Erlang developer since then

INAKA

TODO: Chad's speach for this

My talk is on the scalability of a *web* project that has an *HTTP API* and a component that keeps clients *connected* to the server for *long periods* of time.

It's a design pattern seen in many places

- Chat Rooms
- Social Sites
- Sport Sites

My talk is on the scalability of a *web* project that has an *HTTP API* and a component that keeps clients *connected* to the server for *long periods* of time.

My talk is on the scalability of a *web* project that has an *HTTP API* and a component that keeps clients *connected* to the server for *long periods* of time.

It's a design pattern seen in many places:

- Chat Rooms
- Social Sites
- Sport Sites

SCOPE

We will improve the way we use

- OTP behaviours
- TCP and HTTP connections
- Underlaying system configurations

We will not deal with

- Multiple machines/nodes
- Database choices and/or implementations

MATCH STREAM GENERAL IDEA

A soccer match is played at some stadium

MATCH STREAM GENERAL IDEA

Soccer fans are connected to the internet in their offices

MATCH STREAM GENERAL IDEA

A reporter is at the stadium with his device

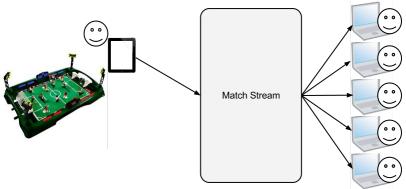

MATCH STREAM GENERAL IDEA

MATCHSTREAM connects them in real time

MATCH STREAM REQUIREMENTS

- Many concurrent users connecting at the same time
- Two-hour-long bursts of connections followed by long periods of inactivity
- Real-time updates

MATCH STREAM REQUIREMENTS

- Many concurrent users connecting at the same time
- Two-hour-long bursts of connections followed by long periods of inactivity
- Real-time updates

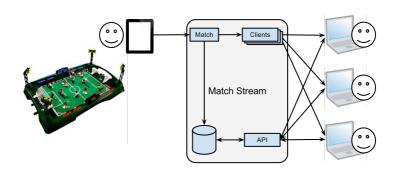

MATCH STREAM REQUIREMENTS

- Many concurrent users connecting at the same time
- Two-hour-long bursts of connections followed by long periods of inactivity
- Real-time updates

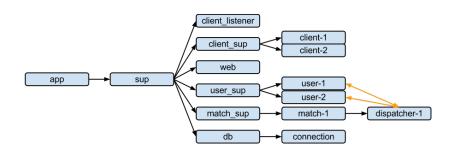

MATCH STREAM GENERAL DESIGN

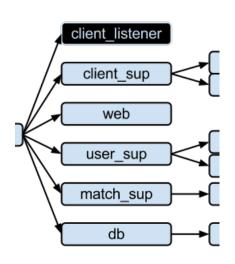

MATCH STREAM ARCHITECTURE

COMPONENTS

CLIENT_LISTENER gen_server.

Listens on a TCP

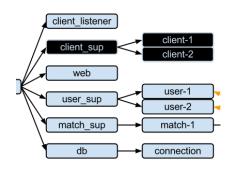

port to receive

client connections

COMPONENTS

CLIENT_SUP supervisor.

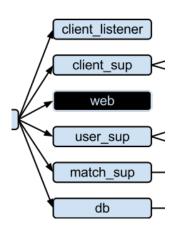

Supervises connection processes

CLIENT gen_fsm.

Handles a TCP connection

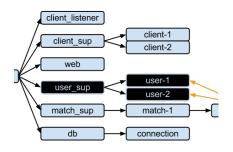

WEB mochiweb server.

Listens for HTTP

API calls

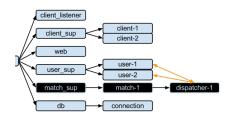

USER_SUP supervisor.
Supervises user processes

USER gen_server.
Subscribes to
match dispatchers
and sends events
to clients

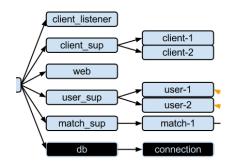

MATCH_SUP supervisor.
Supervises match

MATCH gen_server.
Listens to match
events, stores
them

processes

DISPATCHER gen_event dispatcher. Delivers match events

DB gen_server.
Processes
database
operations

CONNECTION erldis client.

Handles the

connection to the

database

Introduction Match Stream Scaling Final Words

Stage 0: Baseline Stage 1: OS Tune Stage 2: Tune the Code Stage 3: Multi-Node Tuning

LESSON LEARNED

Simply using Erlang to build your system is **not enough** to ensure **scalability**

Stage 0: Baseline Stage 1: OS Tune Stage 2: Tune the Code Stage 3: Multi-Node Tuning

MEASURES

- N *Connections*. Number of connections the server can handle
- C *Concurrency*. Number of multiple connections starting at a time
- ART Average Response Time. How much does it take for the server to send an event

Stage 1: OS Tune
Stage 2: Tune the Code
Stage 3: Multi-Node Tuning

Tools

Test Client

We create our own test client for TCP connections

APACHEBENCH

To test API calls

ENTOP

We use it to check server processes

Stage 0: Baseline Stage 1: OS Tune Stage 2: Tune the Code Stage 3: Multi-Node Tuning

STAGE 0 ESTABLISHING A BASELINE

GOALS

• Find how much the system can handle

STEPS

- Create automated testers
- Install and start the system on a clean machine
- Run the tests on the server's local network
- Test repeatedly adjusting our parameters to maximize them
- Have a human using the system himsel

14/54

Stage 0: Baseline Stage 1: OS Tune Stage 2: Tune the Code Stage 3: Multi-Node Tuning

STAGE 0 ESTABLISHING A BASELINE

GOALS

Find how much the system can handle

STEPS

- Create automated testers
- Install and start the system on a clean machine
- Run the tests on the server's local network
- Test repeatedly adjusting our parameters to maximize them
- Have a human using the system himself

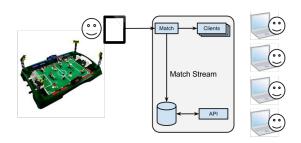

Introduction
Match Stream
Scaling
Final Words

Stage 0: Baseline Stage 1: OS Tune

Stage 2: Tune the Code Stage 3: Multi-Node Tuning

STAGE 1 RESULTS

N 1000 C 4 ART 26s

Stage 1: OS Tune Stage 2: Tune the Code Stage 3: Multi-Node Tuning

Stage 0: Baseline

STAGE 1 Tune the OS and the VM

GOALS

- Improve the underlying Operating System
- Improve the Erlang VM Configuration

SETTINGS TO TUNE UP

- Open files limit
- TCP connections limit
- TCP backlog size
- TCP memory allocation
- Number of Erlang processes

Stage 1: OS Tune Stage 2: Tune the Code Stage 3: Multi-Node Tuning

Stage 0: Baseline

STAGE 1 Tune the OS and the VM

GOALS

- Improve the underlying Operating System
- Improve the Erlang VM Configuration

SETTINGS TO TUNE UP

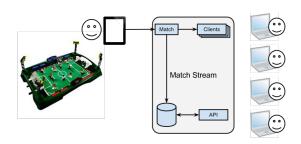

- Open files limit
- TCP connections limit
- TCP backlog size
- TCP memory allocation
- Number of Erlang processes

Stage 0: Baseline
Stage 1: OS Tune
Stage 2: Tune the Code
Stage 3: Multi-Node Tuning

STAGE 1 Results

N 4000 C 4 ART 35s

Stage 0: Baseline Stage 1: OS Tune Stage 2: Tune the Code Stage 3: Multi-Node Tuning

STAGE 2.1 CONNECTION TWEAKS

BACKLOG

- Allow more concurrent connections
- Don't forget TCP tuning your HTTP server

STAGE 2.1 Connection Tweaks

CLIENT_LISTENER

WEB

Stage 0: Baseline Stage 1: OS Tune Stage 2: Tune the Code Stage 3: Multi-Node Tuning

STAGE 2.1 CONNECTION TWEAKS

Outbound Connections

- e.g., database connections
- Don't use just one of them
- You may have separated connections for different purposes

STAGE 2.1 CONNECTION TWEAKS

```
-define (REDIS_CONNECTIONS, 200).
-record(state, {redis :: [pid()]}).
init([]) ->
  Redis =
    lists:map(
      fun(_) ->
        {ok, Conn} = erldis_client:start_link()
        Conn
      end, lists:seq(1, ?REDIS_CONNECTIONS)),
  {ok, #state{redis = Redis}}.
```

STAGE 2.1 CONNECTION TWEAKS

Stage 1: OS Tune
Stage 2: Tune the Code
Stage 3: Multi-Node Tuning

STAGE 2.1 CONNECTION TWEAKS

LISTENERS

- You can listen to more than one port
- For unified urls, use nginx in front of the server

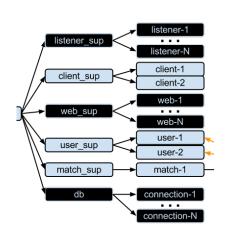

STAGE 2.1 CONNECTION TWEAKS

Stage 1: OS Tune Stage 2: Tune the Code Stage 3: Multi-Node Tuning

Stage 0: Baseline

STAGE 2.1 CONNECTION TWEAKS

LISTENER gen_server. Listens on a TCP port to receive client connections

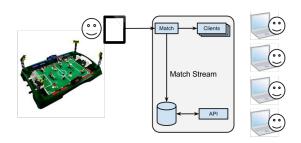

> WEB mochiweb server. Listens for HTTP API calls on a particular port

CONNECTION erldis client. Handles the connection to the database

Stage 0: Baseline Stage 1: OS Tune Stage 2: Tune the Code Stage 3: Multi-Node Tuning

STAGE 2.1 RESULTS

N 8000 C 500 ART 15s

Stage 0: Baseline Stage 1: OS Tune Stage 2: Tune the Code Stage 3: Multi-Node Tuning

STAGE 2.2 GEN_EVENT

SUP_HANDLER

- Don't use it
- Monitor the processes instead

STAGE 2.2

```
EvtMgr =
  match_stream_match:event_manager(MatchId),
ok =
  gen_event: add_handler (EvtMgr,
    {?MODULE, {MatchId, UserId, Client}}, self()),
MgrRef = erlang:monitor(process, EvtMgr) ,
ClientRef = erlang:monitor(process, Client),
{reply, ok,
 State#state{matches =
  [{Client, MatchId, ClientRef, MgrRef}
   | State#state.matches|}}
```

STAGE 2.2

```
handle_info({ 'DOWN' , Ref ,_,Client,_}, State) ->
...

case lists:keytake(Ref, 4, State#state.matches) of
    {value, {Client,_,CRef,Ref}, OtherMatches} ->
...
```

Stage 0: Baseline Stage 1: OS Tune Stage 2: Tune the Code Stage 3: Multi-Node Tuning

STAGE 2.2 GEN_EVENT

Long Delivery Queues

- Distribute the work
- Use repeaters

STAGE 2.2

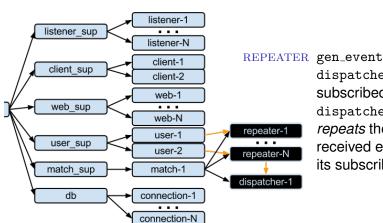

```
start_link(Name, Source) ->
  {ok, Pid} = gen_event:start_link(Name),
  ok = gen_event:add_handler(
         Source, {?MODULE, Pid}, Pid),
  {ok, Pid}.
init(Repeater) ->
  Ref = erlang:monitor(process, Repeater),
  {ok, #state{mgr = Repeater, ref = Ref}}.
. . .
handle_event(Event, State) ->
  gen_event:notify(State#state.mgr, Event),
  {ok, State}.
```

Stage 0: Baseline Stage 1: OS Tune Stage 2: Tune the Code Stage 3: Multi-Node Tuning

STAGE 2.2 GEN_EVENT

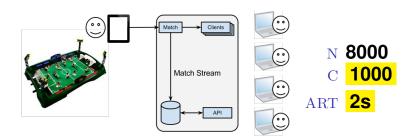

dispatcher. It's subscribed to dispatcher and repeats the received events to its subscribers

Stage 0: Baseline Stage 1: OS Tune Stage 2: Tune the Code Stage 3: Multi-Node Tuning

STAGE 2.2 RESULTS

Stage 0: Baseline Stage 1: OS Tune Stage 2: Tune the Code Stage 3: Multi-Node Tuning

STAGE 2.3 GEN_SERVER

CALL TIMEOUTS

Remember gen_server:reply/2

STAGE 2.3 GEN_SERVER

STAGE 2.3 GEN_SERVER

Memory Footprint

Remember hibernate

Puts the calling process into a wait state where its memory allocation has been reduced as much as possible, which is useful if the process does not expect to receive any messages in the near future.

(Erlang Docs)

STAGE 2.3

```
GEN_SERVER
```

```
handle_cast(Event, State) ->
...
{noreply, State, hibernate}.
...
handle_call(Request, _From, State) ->
...
{reply, Reply, State, hibernate}.
```

Stage 0: Baseline Stage 1: OS Tune Stage 2: Tune the Code Stage 3: Multi-Node Tuning

STAGE 2.3 GEN_SERVER

LONG STARTUP TIME

- Initialize your gen_servers in a 0 timeout
- Move initialization code to handle_info

Stage 1: OS Tune
Stage 2: Tune the Code
Stage 3: Multi-Node Tuning

Stage 0: Baseline

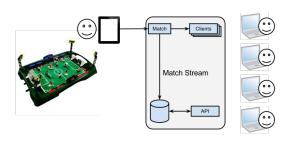

STAGE 2.3 GEN_SERVER

```
init(UserId) ->
    {ok, #state{user = UserId}, 0}.
...
handle_info(timeout, State) ->
    case match_stream_db:user(State#state.user) of
    ...
```

Stage 0: Baseline Stage 1: OS Tune Stage 2: Tune the Code Stage 3: Multi-Node Tuning

STAGE 2.3 RESULTS

N 40K C 5K ART 25ms

STAGE 2.4 SUPERVISORS

SIMPLE ONE FOR ONE SUPERVISORS

- Sometimes simple_one_for_one supervisors get overburdened because they have too many children
- Use a supervisor hierarchy

STAGE 2.4 SUPERVISORS

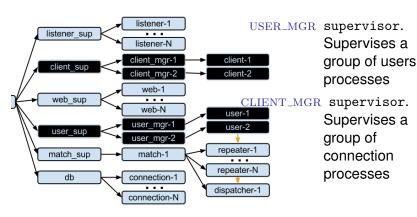

STAGE 2.4 SUPERVISORS

```
start_user(User) ->
  Manager =
    list_to_atom(
      "user-manager-" ++
        integer_to_list(random:uniform(?MANAGERS))),
  supervisor:start_child(Manager, [User]).
```

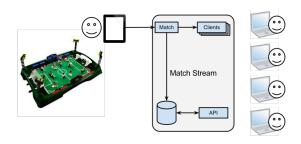

STAGE 2.4 SUPERVISORS

Stage 0: Baseline Stage 1: OS Tune Stage 2: Tune the Code Stage 3: Multi-Node Tuning

STAGE 2.4 RESULTS

Stage 0: Baseline Stage 1: OS Tune Stage 2: Tune the Code Stage 3: Multi-Node Tuning

STAGE 2.5 OTHER PROCESSES

Logging

- Use a good logging system
- Choose carefully what to log

Stage 0: Baseline Stage 1: OS Tune Stage 2: Tune the Code Stage 3: Multi-Node Tuning

STAGE 2.5 OTHER PROCESSES

REGISTRATION

- If everybody agrees on a name, nobody has to find where it is
- You can always register processes both locally and globally

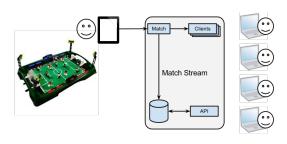

STAGE 2.5 OTHER PROCESSES

Stage 0: Baseline Stage 1: OS Tune Stage 2: Tune the Code Stage 3: Multi-Node Tuning

STAGE 2.5 RESULTS

N 50K C 8K ART 10ms

STAGE 3 Adding Nodes

GOALS

Find the best system topology

STEPS

- Prepare the system to run in more than one node
- Decide if nodes should be connected or independent
- Decide if nodes should be on the same machine or not
- Determine which processes should be registered globally

STAGE 3 Adding Nodes

GOALS

Find the best system topology

STEPS

- Prepare the system to run in more than one node
- Decide if nodes should be connected or independent
- Decide if nodes should be on the same machine or not
- Determine which processes should be registered globally

STAGE 3 ADDING NODES

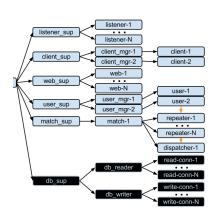

FOR MATCHSTREAM

- We leave the match processes registered locally but we connect them using pg2
- We split db in two:
 - an unique (and therefore) globally registered db_writer
 - a db_reader per node

STAGE 3 ADDING NODES

DB_READER gen_server. One per node.

Processes db read operations

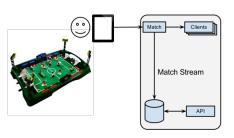

DB_WRITER gen_server. One per system.

Processes db write operations

Stage 0: Baseline Stage 1: OS Tune Stage 2: Tune the Code Stage 3: Multi-Node Tuning

STAGE 3 RESULTS

With four nodes in the same machine:
